If the next change introduces a new working feature, what will the next version be?

The next version will be v0.2.0. A new working feature, such as the battle retake system, is a meaningful new capability, so the MINOR number increases and PATCH resets to 0.

What conditions should be met before your group considers the project ready for Version 1.0.0?

The group will consider Pamana ready for Version 1.0.0 once all planned features are implemented and working, including the storyline, museum restoration visuals, battle retakes, audio, and the settings screen. The full game loop should be playable from start to finish without critical bugs, and Firebase login and progress saving should work reliably, including after the browser is refreshed or reopened.

The quiz content should also be checked for accuracy, ideally by a history teacher or the adviser, and the packaged WebGL build should be tested outside the development environment on other computers and in Chrome, Edge, and Firefox. Finally, the build should be stable enough to be used for the ISO/IEC 25010 evaluation, pre-test and post-test, and engagement questionnaire, and the group and adviser should agree that it is the first complete and stable capstone release.

PART IX. INDIVIDUAL RELEASE CONTRIBUTION

5 Points

Although the release is produced by the group, each student must document their own contribution.

Student Name:	**Policarpio, Lance Angelo A.**
Group Number:	Group IT9
Release Version:	v0.1.0 (First Controlled Development Milestone)
Assigned Release Responsibility:	**Build generation, Deployment/environment configuration, Packaging, and Bug fixing required for release readiness (Lead Developer)**

Specific Contribution:

As the Lead Developer for Group IT9, my primary responsibilities centered on build pipeline engineering, production WebGL packaging, cloud deployment, and resolving critical release-blocking defects:

• **Build Generation & Compilation:** Configured Unity 6 (6000.0.54f1) WebGL Player Settings with the custom PAMANA WebGL template (responsive 16:9 canvas scaling, mobile orientation rotate banner, and Firebase WebGL JS library bridge). Successfully compiled all 32 project scenes (MainMenu, CharacterSelect, Lobby, AltLobby, Hallways, Room 1–12, and BattleScene 1–12) into a high-performance WebAssembly binary and compressed asset bundle (~84.9 MB).

• **Packaging & Distribution:** Created the offline standalone distribution package (Pamana-v0.1.0.zip) containing the preconfigured local HTTP server launcher (run_webgl.bat), verified SHA-256 cryptographic hashes, and authored the official release documentation (README.txt and RELEASE_NOTES.txt).

• **Live Deployment & Cloud Infrastructure:** Deployed and maintained the live game on GitHub Pages (https://nouzen214.github.io/PAMANA/), verified cross-browser compatibility (Chrome, Edge, Firefox), and integrated Firebase Authentication and Realtime Database cloud persistence with local PlayerPrefs fallback.

• **Release Readiness & Bug Fixing:** Diagnosed and resolved essential defects prior to release: added the Lobby portal collision barrier (LockedPortalDoor.cs) preventing room clipping, fixed mobile controls overlay positioning and added proximity 'E' interaction button, expanded Field Guide reading readability by 40%+, and engineered the pixel-art Main Menu hover transitions with dynamic Google account logout logic.

Evidence (Screenshots & Artifact Verification):

The following screenshots and technical logs verify the generation, packaging, repository traceability, live deployment, and functional readiness of release v0.1.0:

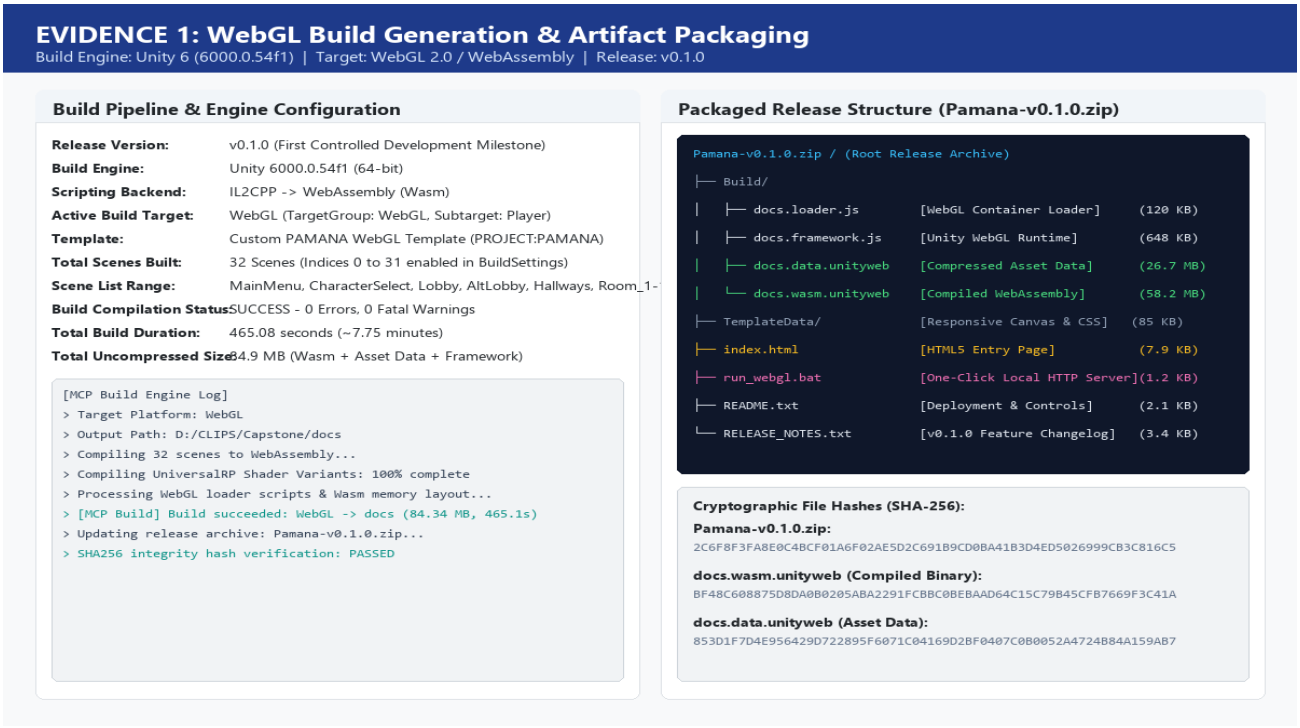

Figure 1: WebGL Build Generation & Artifact Packaging Evidence (Unity 6 output, docs/ directory structure, and Pamana-v0.1.0.zip).

Figure 2: GitHub Repository Traceability & Commit History (Author: Lance Angelo Policarpio [nouzen214], release tag v0.1.0).

EVIDENCE 3: Live Production Deployment (GitHub Pages)

URL: https://nouzen214.github.io/PAMANA/ | Version Identifier: v0.1.0 | Google Cloud Auth

Production WebGL Deployment in Google Chrome / Edge Browser

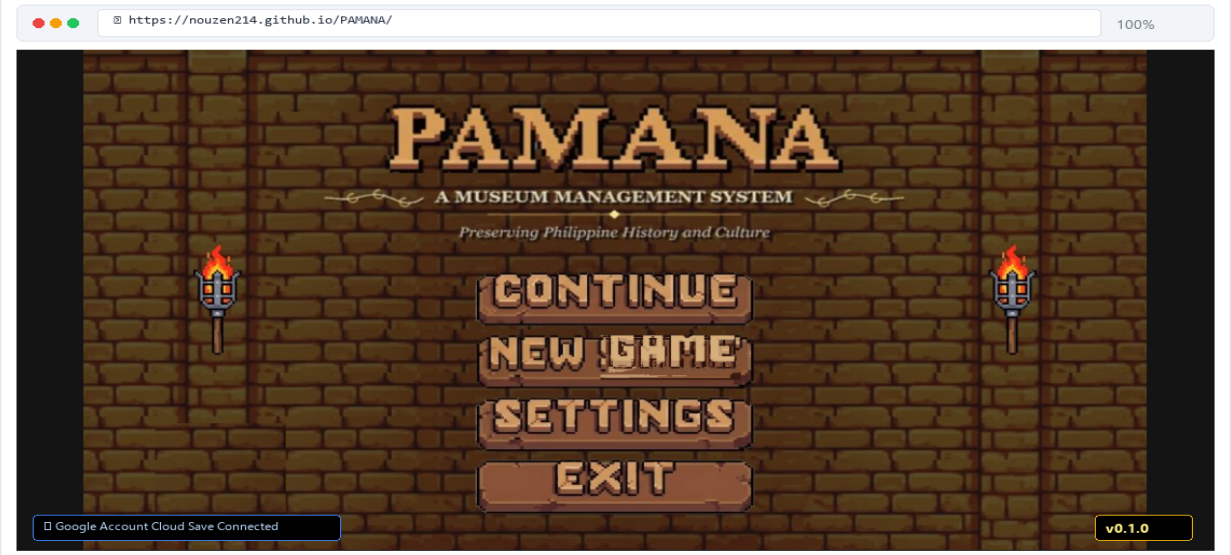

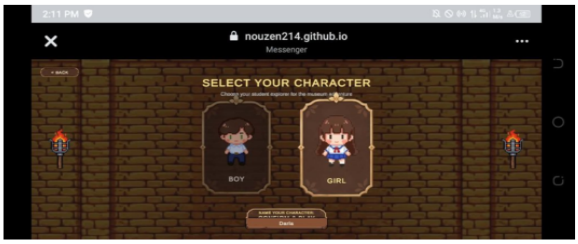

Figure 3: Live Production Deployment on GitHub Pages (https://nouzen214.github.io/PAMANA/) showing v0.1.0 identifier and Main Menu.

EVIDENCE 4: Release Readiness & Critical Bug Fixing Verification

Testing Scope: Dual Character Select, Mobile Controls Ergonomics, Proximity Plaque & Artifact Mount

Dual Character Select System (Darrel & Darla)

Mobile Controls Ergonomics & Proximity 'E' Button

Release Readiness Verification Checklist & Resolved Defects

Defect / Release Requirement	Resolution & Implementation Details	Status
Lobby Portal Barrier Collision	Added solid doorway collider (LockedPortalDoor.cs) preventing room clipping.	VERIFIED PASS
Battle HUD Immediate Rendering	Restructured battle sequence so monster portrait stays hidden until challenge.	VERIFIED PASS
Mobile Touch Controls Ergonomics	Shifted joystick & bag icons to screen edges; added dedicated 'E' interaction button.	VERIFIED PASS
Field Guide Book Readability	Expanded parchment canvas and increased typography size by 40%+ for mobile readability.	VERIFIED PASS
Firebase Cloud Save Persistence	Restored Google Account binding with automated PlayerPrefs fallback mechanism.	VERIFIED PASS
Main Menu Button Hover States	Implemented pixel-art gold glowing hover transitions and dynamic Google logout button.	VERIFIED PASS
Version Display Identification	Dynamic v0.1.0 label anchored in lower-right corner and verified across all platforms.	VERIFIED PASS

Figure 4: Release Readiness & In-Game Bug Fixing Verification (CharacterSelect UI, mobile controls ergonomics, and defect resolutions).

Briefly answer:

What did you learn about the difference between developing software and releasing software?

Limit the answer to approximately 100 words.

Developing software focuses on writing code, implementing gameplay mechanics, and testing features within an ideal development environment like the Unity Editor. In contrast, releasing software demands ensuring that the application runs reliably and predictably in the hands of actual end-users. Releasing requires rigorous version control, clean asset packaging, cross-browser compatibility testing, and eliminating environment-specific dependencies. While development tolerates debug scripts and placeholders, releasing requires strict traceability, automated build verification, deployment infrastructure, and ensuring that features like cloud persistence and responsive UI perform flawlessly across diverse client devices outside the editor.

Word Count: 90 words

Release Verification Summary	Outcome
Target Platform Build Execution	**PASS (32 scenes compiled to WebGL)**
Standalone Distribution Package (ZIP + Launcher)	**PASS (Pamana-v0.1.0.zip + run_webgl.bat)**
Live Cloud Deployment & Hosting	**PASS (GitHub Pages SSL Deployed)**
Version Traceability & Git Tagging	**PASS (Tag v0.1.0 linked to commit)**
Release Readiness & Defect Resolution	**PASS (All 7 critical defects resolved)**
